

# CSC 372 Final Project – LLM + Frama-C Study

## Course & Submission Details

- **Course:** CSC 372 – Fall 2025 (Instructor: Roberto Giacobazzi)
- **Deliverable:** Single PDF report uploaded to D2L (deadline: Dec 10, 2025)
- **Team:**
  - Mohamed Diakhate
  - Andrew Huynh
  - Ravshanbek Temurbekov
  - Carlo Rogielo Utrilla Aquino

## Introduction

For this project we used an LLM to help write C code that either satisfies or violates the given ACSL specs, then checked everything with Frama-C. For each of the four parts we made two versions: one that should pass verification and one that should fail. We saved all our conversations with the LLM (prompts, responses, timestamps, model settings) and included the code and Frama-C reports in this write-up.

## Methodology

We used `gpt-4o-mini` for all the code generation. For the “good” versions we set temperature to 0.2 to get more consistent results, and for the “bad” versions we used 0.6 to let the model make mistakes. We wrote the ACSL specs ourselves and gave the LLM the same basic prompt each time (shown below), just changing the temperature.

To verify everything we ran `frama-c -wp` on each file and saved the reports. We’re on macOS and installed Frama-C through OPAM with Alt-Ergo as the prover.

## Base Prompt Template

Model: `gpt-4o-mini`

Temperature: 0.2 (deterministic run) or 0.6 (more exploratory)

Base prompt (used for each part, swapping in the appropriate spec and function name):

---

You are helping me complete a CSC 372 verification assignment. I will give you a C function

Requirements:

1. Do not remove or edit the ACSL comment block.
2. Keep the implementation iterative (no recursion) and use simple loops/conditionals as needed.
3. Add loop invariants/variants if the verification tool would reasonably require them.

4. Do not introduce extra helper functions or headers; stay within the stub provided.
5. Follow the intent of the spec precisely; no undefined behavior.

Return ONLY the completed function definition. Assume `#include <stddef.h>` is already present  
---

For "falsifying" versions we reuse the same prompt but allow a higher temperature (0.6) so that

## P1 – Swap Two Array Elements

**Specification:** Swap indices  $k$  and  $j$  of array  $a$  (length  $n$ ) using arithmetic/bitwise ops without disturbing other entries.

### Discussion

The satisfying version uses XOR-swap with an explicit assertion on the indices; Frama-C validates all postconditions. The falsifying version mistakenly writes to  $a[k]$  twice, so  $a[j]$  keeps its old value and WP reports the unmet postconditions.

### LLM Settings

- **Satisfying:** Model gpt-4o-mini, temperature 0.2, timestamp 2025-12-08T10:05:12-07:00
- **Falsifying:** Model gpt-4o-mini, temperature 0.6, timestamp 2025-12-08T10:09:44-07:00

### Transcript – Satisfying

Model: gpt-4o-mini

## P2 – Strictly Descending Flag

**Specification:** Set `*desc` to 1 iff the original array is strictly descending; otherwise 0 (witness exists).

### Discussion

The satisfying attempt now records witness indices the moment a non-descending pair is found, exposing the existential directly to WP. However, Alt-Ergo still times out on the final quantified postconditions under default limits, so we document the pending goals. The falsifying version only inspects the first two elements, so WP immediately flags the missing global reasoning.

### LLM Settings

- **Satisfying:** Model gpt-4o-mini, temperature 0.2, timestamp 2025-12-08T13:12:05-07:00
- **Falsifying:** Model gpt-4o-mini, temperature 0.6, timestamp 2025-12-08T10:25:18-07:00

### Transcript – Satisfying

## P3 – Left Rotation by One

**Specification:** Rotate a one step left (iterative):  $a[i] = v[i+1]$  for  $i < n-1$ ,  $a[n-1] = v[0]$ .

### Discussion

The satisfying version now tracks both the processed prefix and untouched suffix in the loop invariant. This matches WP's recommended pattern for array rotations, yet the invariant-preservation VC still times out under default Alt-Ergo. We document the pending goal. The falsifying version still loses the saved element, so every substantive goal fails.

### LLM Settings

## P4 – Conditional Transform (Zero or Index)

**Specification:** Write 0 when  $V[k] \leq 0$ , else write the index  $k$ .

### Discussion

The satisfying version maintains both prefix/suffix invariants so WP discharges every goal. The falsifying version treats zero as positive, giving the expected counterexample.

### LLM Settings

Prompt:

You are helping me complete a CSC 372 verification assignment. I will give you a C function

Requirements:

1. Do not remove or edit the ACSL comment block.
2. Keep the implementation iterative (no recursion) and use simple loops/conditionals as needed.
3. Add loop invariants/variants if the verification tool would reasonably require them.
4. Do not introduce extra helper functions or headers; stay within the stub provided.
5. Follow the intent of the spec precisely; no undefined behavior.

Return ONLY the completed function definition. Assume #include <stddef.h> is already present

...

```
#include <stddef.h>
```

```
/*@
  requires n >= 0;
  requires \valid(a + (0 .. n-1));
  assigns a[0 .. n-1];
  ensures \forall integer k; 0 <= k < n ==> ((\old(a[k]) <= 0 ==> a[k] == 0) && (\old(a[k])
```

\*/

```
void p4_transform(int *a, int n) {
    // TODO
}
```

```

Response:

```

```
void p4_transform(int *a, int n) {
    int k = 0;
    /*@ loop invariant 0 <= k <= n;
       loop invariant \forall integer i; 0 <= i < k ==>
         (\at(a[i], Pre) <= 0 ==> a[i] == 0) &&
         (\at(a[i], Pre) > 0 ==> a[i] == i));
       loop invariant \forall integer i; k <= i < n ==> a[i] == \at(a[i], Pre);
       loop assigns k, a[0 .. n - 1];
       loop variant n - k;
    */
    while (k < n) {
        int original = a[k];

## Summary

We completed all four parts of the assignment. P1 and P4 passed all Frama-C checks completely. For P2 and P3, we got most of the way there but Alt-Ergo timed out on some of the quantified postconditions even though we added stronger invariants. The assignment says partial credit is fine when the prover can't finish, so we documented those timeouts honestly.

All four “bad” versions failed at least one verification goal as expected, which shows Frama-C caught the bugs we introduced. We kept all our LLM conversations logged with timestamps and included the exact code and Frama-C outputs in this report.
